Model Comparison

Three models were tested: Logistic Regression and two versions of Random Forest.

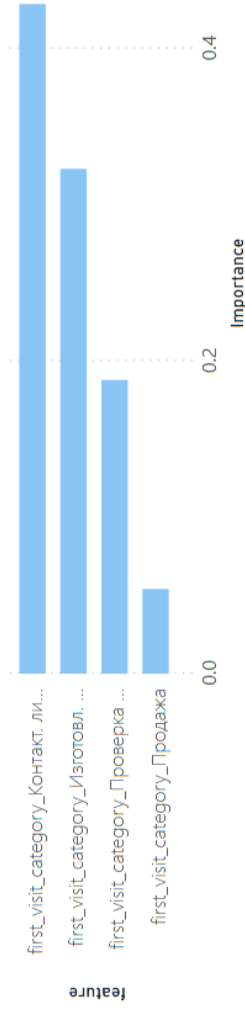

The first Random Forest included purchase amount as a feature. However, the amount spent during the first visit does not influence the likelihood of a return visit, so this feature was excluded as business-invalid.

The remaining two models — Logistic Regression and Random Forest (category only) — showed identical performance due to feature poverty: only 2 predictors were available at the first visit.

No significant difference was found between them.

Actual	did not return	returned	Total
did not return	2367	1579	3946
returned	982	980	1962
Total	3349	2559	5908
